

Chit 18 — MongoDB: orderinfo Advanced Queries

Note: Uses the orderinfo collection from Chit 9.

i. Add 'Age' field to orderinfo collection

```
db.orderinfo.updateMany(  
  {},  
  { $set: { Age: 25 } }  
)  
  
// Or set different ages per document:  
db.orderinfo.updateOne(  
  { cust_id: 123 },  
  { $set: { Age: 30 } }  
)
```

ii. Create compound index, fire queries, drop duplicates

```
// Create compound index  
db.orderinfo.createIndex({ cust_id: 1, status: 1 })  
  
// Fire query using compound index  
db.orderinfo.find({ cust_id: 123, status: 'A' })  
  
// Create unique index (drops duplicates conceptually)  
db.orderinfo.createIndex(  
  { cust_id: 1 },  
  { unique: true }  
)  
  
// Show all indexes  
db.orderinfo.getIndexes()
```

iii. Average price for each customer grouped by status

```
db.orderinfo.aggregate([  
  { $group: { _id: '$status',  
              avg_price: { $avg: '$price' } } }  
)
```

iv. Change customer name where status is 'B'

```
db.orderinfo.updateMany(  
  { status: 'B' },  
  { $set: { cust_name: 'updated_name' } }  
)
```
